Homework 1: Control hw01.zip (hw01.zip)

Due by 11:59pm on Thursday, 1/31

Instructions

Download hw01.zip (hw01.zip).

Submission: When you are done, submit with python3 ok --submit. You may submit more than once before the deadline; only the final submission will be scored. Check that you have successfully submitted your code on okpy.org (https://okpy.org/). See Lab 0 (/lab/lab00#submitting-the-assignment) for more instructions on submitting assignments.

Using Ok: If you have any questions about using Ok, please refer to this guide. (/articles/using-ok.html)

Readings: You might find the following references useful:

- Section 1.2 (http://composingprograms.com/pages/12-elements-of-programming.html)
- Section 1.3 (http://composingprograms.com/pages/13-defining-new-functions.html)
- Section 1.4 (http://composingprograms.com/pages/14-designing-functions.html)
- Section 1.5 (http://composingprograms.com/pages/15-control.html)

Grading: Homework is graded based on effort, not correctness. However, there is no partial credit; you must show substantial effort on every problem to receive any points.

Homework Questions

Q0: Welcome Survey

Please complete this welcome survey (https://goo.gl/forms/feBnXxIESOZi3QIk1) before you submit your homework. Your responses will not be visible to anyone outside the course.

Q1: A Plus Abs B

Fill in the blanks in the following function for adding a to the absolute value of b, without calling abs. You may **not** modify any of the provided code other than the two blanks.

https://cs61a.org/hw/hw01/

```
from operator import add, sub

def a_plus_abs_b(a, b):
    """Return a+abs(b), but without calling abs.

>>> a_plus_abs_b(2, 3)
5
>>> a_plus_abs_b(2, -3)
5
"""

if b < 0:
    f = _____
else:
    f = _____
return f(a, b)</pre>
```

Use Ok to test your code:

```
python3 ok -q a_plus_abs_b
```

Q2: Two of Three

Write a function that takes three *positive* numbers and returns the sum of the squares of the two largest numbers. **Use only a single line for the body of the function.**

```
def two_of_three(a, b, c):
    """Return x*x + y*y, where x and y are the two largest members of the
    positive numbers a, b, and c.

>>> two_of_three(1, 2, 3)
13
>>> two_of_three(5, 3, 1)
34
>>> two_of_three(10, 2, 8)
164
>>> two_of_three(5, 5, 5)
50
    """
return _____
```

Hint: Consider using the max or min function:

```
>>> max(1, 2, 3)
3
>>> min(-1, -2, -3)
-3
```

https://cs61a.org/hw/hw01/ 2/8

Use Ok to test your code:

```
python3 ok -q two_of_three
```

Q3: Largest Factor

Write a function that takes an integer n that is **greater than 1** and returns the largest integer that is smaller than n and evenly divides n.

```
def largest_factor(n):
    """Return the largest factor of n that is smaller than n.

>>> largest_factor(15) # factors are 1, 3, 5
5
>>> largest_factor(80) # factors are 1, 2, 4, 5, 8, 10, 16, 20, 40
40
>>> largest_factor(13) # factor is 1 since 13 is prime
1
    """
    "**** YOUR CODE HERE ***"
```

Hint: To check if b evenly divides a, you can use the expression a % b == 0, which can be read as, "the remainder of dividing a by b is 0."

Use Ok to test your code:

```
python3 ok -q largest_factor
```

Q4: If Function vs Statement

Let's try to write a function that does the same thing as an if statement.

https://cs61a.org/hw/hw01/ 3/8

```
def if_function(condition, true_result, false_result):
    """Return true_result if condition is a true value, and
    false_result otherwise.

>>> if_function(True, 2, 3)
2
>>> if_function(False, 2, 3)
3
>>> if_function(3==2, 3+2, 3-2)
1
>>> if_function(3>2, 3+2, 3-2)
5
"""

if condition:
    return true_result
else:
    return false_result
```

Despite the doctests above, this function actually does *not* do the same thing as an if statement in all cases. To prove this fact, write functions c, t, and f such that with_if_statement prints the number 2, but with_if_function prints both 1 and 2.

https://cs61a.org/hw/hw01/ 4/8

```
def with_if_statement():
    ....
    >>> result = with_if_statement()
    2
    >>> print(result)
    ....
    if c():
        return t()
    else:
        return f()
def with_if_function():
    >>> result = with_if_function()
    >>> print(result)
    ....
    return if_function(c(), t(), f())
def c():
    "*** YOUR CODE HERE ***"
def t():
    "*** YOUR CODE HERE ***"
def f():
    "*** YOUR CODE HERE ***"
```

Hint: If you are having a hard time identifying how an if statement and if_function differ, consider the rules of evaluation for if statements and call expressions.

Use Ok to test your code:

```
python3 ok -q with_if_statement
python3 ok -q with_if_function
```

Q5: Hailstone

Douglas Hofstadter's Pulitzer-prize-winning book, *Gödel, Escher, Bach*, poses the following mathematical puzzle.

- 1. Pick a positive integer n as the start.
- 2. If n is even, divide it by 2.
- 3. If n is odd, multiply it by 3 and add 1.
- 4. Continue this process until n is 1.

https://cs61a.org/hw/hw01/ 5/8

The number n will travel up and down but eventually end at 1 (at least for all numbers that have ever been tried -- nobody has ever proved that the sequence will terminate). Analogously, a hailstone travels up and down in the atmosphere before eventually landing on earth.

This sequence of values of $\,n\,$ is often called a Hailstone sequence. Write a function that takes a single argument with formal parameter name $\,n\,$, prints out the hailstone sequence starting at $\,n\,$, and returns the number of steps in the sequence:

```
def hailstone(n):
    """Print the hailstone sequence starting at n and return its
    length.

>>> a = hailstone(10)
10
5
16
8
4
2
1
>>> a
7
"""
"**** YOUR CODE HERE ***"
```

Hailstone sequences can get quite long! Try 27. What's the longest you can find? Use Ok to test your code:

```
python3 ok -q hailstone
```
